

TAGTOG Brand Strategy

Core Brand Idea

Turning complex event operations into one connected flow.

Brand Name

TAG: Titan Andalan Global

TOG: Technology, Operations & Growth

The three elements describe the experience TAGTOG creates:

- Technology connects the people, information, and systems.
- Operations become clearer and easier to manage.
- Growth becomes possible without creating more complexity.

Vision:

To become the most trusted connected event operations ecosystem for organizations worldwide, setting the standard for clear, secure, and scalable event operations.

Mission:

Our mission is to make every event **CLEAR**—connecting fragmented information, making important details easy to locate, ensuring consistent master data, accounting for every change, and routing the right information to the right people.

- **C** — Connect fragmented information
 - **L** — Locate what matters quickly
 - **E** — Ensure consistent master data
 - **A** — Account for every change
 - **R** — Route the right information to the right people
-

1. Brand Purpose

Why Do We Exist?

We exist to bring clarity, trust, and control to complex event operations—so teams can focus on creating meaningful experiences instead of managing fragmented information.

Events bring people together, but the work behind them is often fragmented across spreadsheets, documents, chats, applications, and different teams.

We want to create a future where every person involved in an event can understand what needs to happen, who is responsible, and where the latest information can be found.

2. Target Audience

Primary Audience

Organizations that regularly manage events involving multiple teams, stakeholders, vendors, documents, and approval processes:

- Professional event organizers
- In-house event and marketing communication teams of multi-sector teams.
- Hotels and venues
- Government institutions
- Event vendors, sponsors, and suppliers

Secondary Audience

Organizations that participate in or support the wider event ecosystem:

- IT principals and resellers
- Financial-service companies
- Mining companies
- Educational institutions
- Other organizations with active marketing, communication, or event functions

Buyers

The people who control the budget or approve the commercial engagement:

- Business owners and founders
- CEOs and managing directors
- COOs and operational directors
- CMOs and marketing directors

Decision-Makers

The people responsible for selecting and approving the solution:

- CMO or marketing director
- VP or Head of Marketing Communication
- Head of Events or Event Director
- COO or Head of Operations
- Country Director of an IT principal
- CEO or Managing Director

Technical Evaluators and Influencers

The people responsible for evaluating security, access, integration, and technical feasibility:

- CIO or CTO
- Head of IT
- IT managers
- Information-security teams
- Procurement teams

Users

- Marketing communication teams
- Event organizers and event managers
- Project managers
- Event operations teams
- Administrative teams
- Sales and customer relationship teams
- Vendor coordinators

Customer Characteristics

Our customers commonly experience the following:

- **Dynamic environments**
 - Plans, requirements, and information can change quickly.
 - **Fast-paced and deadline-driven operations**
 - Teams must make decisions and execute within fixed timelines.
 - **Quality- and detail-conscious expectations**
 - Small inconsistencies can affect the quality and success of an event.
 - **Collaboration-intensive workflows**
 - Multiple internal teams, clients, vendors, venues, and partners must work together.
 - **Information-dependent operations**
 - Teams rely on accurate, current, and accessible information to perform their responsibilities.
-

3. Customer Insight

Core Customer Insight

Our customers manage large amounts of operational information, but that information is often fragmented across spreadsheets, proposals, contracts, rundowns, reports, emails, chat messages, and shared folders.

The same master data—such as client details, event schedules, venues, speakers, vendors, participants, budgets, and project responsibilities—is repeatedly copied into different documents. When information changes, not every document is updated consistently.

As a result, teams cannot always confidently answer:

- Which information is the latest and correct version?
- Where can the required information be found?
- Which document should be used as the reference?
- Who created, changed, or approved the information?
- When was the information last updated?
- Who is permitted to view or modify it?

The customer's problem is therefore not a lack of information. It is the lack of a reliable, searchable, traceable, and controlled source of information.

What Is Happening in the Customer's World?

Event operations generate many documents, and information changes continuously throughout planning and execution.

A schedule may be updated in the rundown but remain unchanged in the proposal. A speaker's details may be different across the registration form, event brief, and production document. Vendor, venue, participant, or budget information may exist in several files maintained by different people.

Teams spend significant time searching for information, comparing documents, confirming which version is correct, and manually notifying others about changes.

These activities are often accepted as a normal part of event management, even though they create delays, errors, security risks, and unnecessary administrative work.

Current Customer Problems

Fragmented Information

Information is distributed across different systems, documents, folders, emails, and chat groups. Employees must know where to search and whom to ask before they can find what they need.

Inconsistent Master Data

Important master data is copied into multiple operational documents and updated separately. This creates conflicting versions of client, event, venue, vendor, speaker, participant, schedule, and budget information.

Difficulty Finding Information

Even when the information exists, it may be buried inside long documents or scattered across multiple files. Teams lose time opening, reading, and comparing documents to locate a specific detail.

Unclear Source of Truth

There is no single reliable location that clearly indicates which information is current, approved, and ready to use.

Limited Audit Trails

Organizations cannot easily track:

- Who created or changed information

- What information was changed
- When the change occurred
- Why it was changed
- Who reviewed or approved it

When a problem occurs, teams must manually reconstruct the history from messages, emails, and different document versions.

Weak Permission and Access Control

Documents may be shared through open links, shared accounts, personal storage, or chat groups. This makes it difficult to ensure that each person can only access or modify the information relevant to their role.

Access may also remain available after an employee, vendor, or external partner is no longer involved.

Dependence on Individual Knowledge

Employees often remember where information is stored and which document is correct. When they are unavailable or leave the organization, part of the operational knowledge may disappear with them.

The Deeper Customer Need

Customers do not simply need another place to upload documents.

They need a connected system that:

- Maintains consistent master data across workflows
- Makes operational information easier to search and retrieve
- Establishes a clear source of truth
- Records changes and approvals
- Controls access based on roles and responsibilities
- Connects information across EMS, PMS, CRM, and IAM
- Reduces dependence on manual document comparison
- Preserves organizational knowledge over time

Potential Future Problems

As organizations manage more events, teams, documents, and stakeholders, these problems become more serious:

- Conflicting master data produces larger operational mistakes.

- Finding information becomes slower as the document library grows.
 - Security and privacy risks increase as more external stakeholders receive access.
 - Audit and compliance requirements become harder to satisfy.
 - New employees require more time to understand where information is stored.
 - Reporting becomes less reliable because it is based on inconsistent sources.
 - Integrating new systems becomes more difficult.
 - Business decisions are made using incomplete or outdated information.
 - AI produces unreliable answers when the underlying data is fragmented or inconsistent.
-

4. Positioning

Positioning Statement

For organizations managing complex events across multiple teams and stakeholders, TAGTOG is a connected event operations ecosystem that brings workflows, master data, documents, audit trails, and access into one reliable flow.

Unlike disconnected applications, TAGTOG connects your business needs with EMS, PMS, CRM, and IAM through a shared foundation shaped by firsthand understanding of event operations.

Category

Connected Event Operations Ecosystem

Primary Benefit

Customers gain:

- One clearer operational flow
- Better alignment between teams
- More consistent information
- More controlled access
- Greater visibility from planning to reporting
- A system that can expand as their operations grow

5. Differentiation

What Makes TAGTOG Different?

Built from Inside the Event Industry

TAGTOG combines firsthand event-industry knowledge with a connected product ecosystem. We understand how information moves between organizers, clients, venues, vendors, participants, and internal teams—and translate those relationships into connected workflows.

One Connected Ecosystem

EMS, PMS, CRM, and IAM are not positioned as unrelated products. They are designed to support different parts of one operational journey.

For example:

- CRM maintains the relationship and client information.
- EMS manages the event flow.
- PMS organizes the project and responsibilities.
- IAM controls who can access each system and action.

Start with What Is Needed

Customers do not need to adopt the entire ecosystem immediately. They can begin with their most urgent operational requirement and introduce additional capabilities as they grow.

Product First, Extensions Where Valuable

TAGTOG begins with structured products. Configuration, integration, and selective development are provided where they strengthen the customer's ecosystem.

We do not position ourselves as a software house that will build anything without considering its long-term impact.

Practical AI Within the Ecosystem

AI is introduced within EMS, PMS, and CRM where it can reduce repetitive work, summarize information, identify missing steps, and help users act more quickly.

It is not presented as a separate product or used merely as a marketing label.

How Do We Remain Different If Competitors Copy Us?

Competitors can copy features or use similar messaging. Our long-term advantage must come from:

- Firsthand knowledge of event workflows
- Strong relationships across the event ecosystem
- Products designed to work together
- A consistent identity and access structure
- Reusable integrations and operational workflows
- Experience gained from real event implementations
- Customer trust and close collaboration
- An ecosystem that becomes more valuable as additional modules are introduced

Features can be copied. A connected product ecosystem, industry knowledge, partner network, and trusted implementation experience are much harder to reproduce.

6. Brand Promise

Our Promise to Customers

With TAGTOG, everyone involved in an event should know what needs to happen, who is responsible, and where the latest information can be found.

Customers should consistently experience:

- Clearer responsibilities
 - More organized information
 - Better-controlled access
 - Fewer disconnected operational steps
 - Honest recommendations
 - A clear path for expanding their system
-

7. Brand Personality

TAGTOG behaves like an experienced organizer who can enter a complicated situation, understand how everything connects, and turn it into a clear plan.

We:

- Listen before recommending.
 - Organize complexity into clear priorities.
 - Make responsibilities and next steps visible.
 - Connect existing capabilities before adding new ones.
 - Explain technology without trying to impress people with technical terminology.
 - Build for future growth without overcomplicating today.
 - Question requests that would create unnecessary fragmentation.
 - Stay involved until the system makes sense to the people using it.
-

8. Brand Voice

Clear

We use direct, understandable language and make the next step obvious.

Calm and Confident

We communicate with confidence without exaggerating our capabilities or creating fear.

Business-First

We begin with the customer's workflow and outcome—not with our technology.

Practical

We explain how the solution changes everyday work through specific examples.

Human

Communicate like an experienced organizer, not a technical manual.

Language Guidelines

Instead of:

“An AI-powered end-to-end event transformation platform.”

Say:

“Keep your event information organized, reduce repetitive work, and help every team understand what comes next.”

Instead of:

“We deliver fully customized software solutions.”

Say:

“Begin with our core products and extend the ecosystem where your operations require it.”

Instead of:

“Our integrated solution increases operational efficiency.”

Say:

“Bring your teams, documents, responsibilities, and approvals into one connected flow.”

9. Messaging Pillars

Pillar 1: Reliable Information

Find the latest information without searching through multiple documents.

Pillar 2: One Connected Flow

Bring workflows, documents, master data, and responsibilities together.

Pillar 3: Traceability and Control

Understand what changed, who changed it, and who has access.

Pillar 4: Growth Without More Complexity

Start with what you need today and expand without creating more disconnected systems.

Pillar 5: Useful Innovation

Use automation and embedded AI to reduce repetitive work—not to add another layer of complexity.

10. Brand Story

Events are created to connect people, ideas, and opportunities.

But behind every event are countless moving parts: teams, clients, venues, vendors, documents, approvals, participants, and deadlines. As events become larger, the work behind them often becomes increasingly fragmented.

Important information ends up spread across spreadsheets, documents, emails, chats, and separate applications. Teams spend more time checking, confirming, and following up instead of focusing on the event itself.

TAGTOG was created to bring these moving parts into one connected flow.

Through an ecosystem of EMS, PMS, CRM, and IAM products, TAGTOG helps organizations connect event workflows, project responsibilities, customer relationships, and access management.

Customers can begin with what they need today and expand as their operations develop.

This is what Technology, Operations & Growth means to TAGTOG:

Technology connects the system. Operations become clearer. Growth becomes easier to manage.

11. Elevator Pitch

One Sentence

TAGTOG turns fragmented event operations into one connected flow, bringing teams, workflows, information, and access together from planning to reporting.

15-Second Version

TAGTOG is a connected event operations ecosystem that brings EMS, PMS, CRM, and IAM together, helping every team work from the same information and understand what comes next.

30-Second Version

Managing an event often means coordinating multiple teams, vendors, documents, approvals, and applications. TAGTOG brings those moving parts into one connected ecosystem through EMS, PMS, CRM, and IAM. Organizations can begin with the product they need today and expand as their operations grow—without repeatedly rebuilding their systems from the beginning.

Recommended Brand Lockup

TAGTOG

Technology. Operations. Growth.

Flow Smarter. Grow Further.

Connected operations for events that keep moving.

Or

Everything in Flow. Everyone in Sync.

One trusted place for every update, decision, and next step.
